Dear Mr. Carlson:

Stone & Webster Engineering Corporation, Division of Environmental and Infrastructure is conducting a site investigation for the Colorado Air National Guard at Buckley Air National Guard Base in Aurora, Colorado. We request that you provide us with a list of federally listed threatened and endangered species, candidate, and species of concern potentially occurring or known to occur in that area.

The specific legal locations in which we are interested are Sections 8-17 and 21-28, Township 4 South, Range 66 West. A general area map is also enclosed.

Should you have any questions, please contact me at 741-7345.

For Stone & Webster Engineering Corporation.

Mr. David P. Kane
Terrestrial Ecologist
Stone and Webster Engineering Corporation
P.O. Box 5406
Denver, Colorado 80217-5406

Dear Mr. Kane:

In response to your letter of January 23, 1997, the U.S. Fish and Wildlife Service is providing the list of Federally listed species requested for the Buckley Air National Guard Base located in Aurora, Arapahoe County, Colorado. This list and comments should be helpful in your preparation of the environmental evaluation of the project area. These comments have been prepared under the provisions of the Endangered Species Act of 1973 (ESA), as amended (16 U.S.C. 1531 et. seq.).

The federally listed threatened and endangered species that could occur at or visit the proposed site include:

Birds: Bald eagle, *Haliaeetus leucocephalus*, Threatened
Mammals: Black-footed ferret, *Mustela nigripes*, Endangered
Plants: Ute ladies'-tresses orchid, *Spiranthes diluvialis*, Threatened

The project site lies within the range of the Ute ladies'-tresses orchid. The Service's *Spiranthes* Interim Survey Guidelines (November 1992) calls for orchid surveys wherever a project development might have direct or indirect impacts on the 100-year floodplain of the South Platte River, Fountain Creek, or any of the perennial tributaries to these streams at or below 6,500 feet elevation. The Service recommends a plant survey be conducted in all suitable orchid habitat within the project site to determine if development of the site will impact this orchid. If it is determined that the project would have an unavoidable impact on any *Spiranthes* population, this office should be contacted to discuss appropriate Section 7 consultation requirements.

Additionally, any water depletions to the South Platte River system may need to be consulted on with the Service as stipulated in section 7 of the ESA. It has been determined by the

Mr. David P. Kane

2

Service that any depletions to this river system will have detrimental effects on nine threatened or endangered species found in Nebraska. Those species are: whooping crane; piping plover; least tern; Western prairie fringed orchid; American burying beetle; bald eagle; peregrine falcon; Eskimo curlew; and the pallid sturgeon.

The Service also is interested in the protection of species which are candidates for official listing as threatened or endangered (Federal Register, Vol. 56, No. 225, November 21, 1991; Vol. 55, No. 35, February 21, 1990). While these species presently have no legal protection under the ESA, it is within the spirit of this Act to consider project impacts to potentially sensitive candidate species. It is the intention of the Service to protect these species before human-related activities adversely impact their habitat to a degree that they would need to be listed and, therefore, protected under the ESA. Additionally, we wish to make you aware of the presence of Federal candidates should any be proposed or listed prior to the time that all Federal actions related to the project are completed. If any candidate species will be unavoidably impacted, appropriate mitigation should be proposed and discussed with this office.

The list of Federal candidate species that could occur at or visit the proposed site include:

- Mammals: Preble's meadow jumping mouse, *Zapus hudsonius preblei*, Candidate
 Swift fox, *Vulpes velox*, Candidate for Listing
- Plants: Colorado butterflyweed, *Gaura neomexicana* ssp. *coloradensis*, Candidate
- Birds: Mountain plover, *Charadrius montanus*, Candidate for Listing

You should contact the Colorado Division of Wildlife to address any concerns it may have. The contact person for this area is Dave Weber of the Denver Office at (303) 291-7231. If the Service can be of further assistance, contact Clay Ronish of this office at (303) 275-2370.

Sincerely,

LeRoy W. Carlson
Colorado Field Supervisor

APPENDIX D

Geophysical Report

Former Warehouse Area Site Investigation
Buckley Air National Guard Base
Aurora, Colorado

Complete report of geophysical investigation activities.

*** * * This page intentionally left blank. * * ***

November 29, 1996

Andrew B. Ellison
Stone and Webster Engineering Corporation
7677 E. Berry Avenue
Englewood, CO 80111

Dear Andrew,

This letter is a correction sheet for the geophysical survey performed for Stone and Webster at the Buckley Field, Air National Guard (ANG) property east of Denver, Colorado. The field work was performed on October 17, and the final report was transmitted to you on October 22, 1996.

The correction involves only the units of the EM-61 data presented in the final report. The correct units for the electromagnetic data are millivolts in all cases. While this correction does not change the EM values on the maps, the contours on the maps, nor any of the interpretations, a copy of this letter should be attached to each copy of the report to prevent future misunderstandings. Four copies of the letter are included for your use.

If you have any questions, please call Mr. Phil Sirles or myself. It was a pleasure to work for you on the ANG project site; we hope your investigation is proceeding well.

Sincerely,

Mary Ann Fore
President

October 22, 1996

Andrew B. Ellison
Stone and Webster Engineering Corporation
7677 East Berry Avenue
Englewood, CO 80111

Dear Mr. Ellison,

This letter report summarizes procedures and results of a geophysical survey performed at the Buckley Field, Air National Guard (ANG) property east of Denver, Colorado (Figure 1).

OBJECTIVES:

On October 17, 1996, MicroGeophysics Corporation (MGC) conducted an electromagnetic and magnetic survey at the Buckley Field ANG property located east of Denver off 6th Avenue. Objectives of the geophysical surveys were twofold: 1) to determine if a geophysical response indicative of an underground storage tank is present at the Former Motor Pool Site; and, 2) if a geophysical response indicative of a buried well casing is present at the OMS Warehouse Site (near demolished building 505). Geophysical surveys were performed at the Former Motor Pool Site (FMP) and the OMS Warehouse Site (OMS), near the demolished Building 505 (Figure 2).

METHODS:

Magnetic (mag) surveys were completed using a Geometrics Model 858 Cesium magnetometer with line spacings of five feet (east to west) and station spacings at 0.3 second intervals (north to south), which at normal walking speed is approximately one reading every foot. The mag sensor was maintained approximately six feet above the ground for the duration of the survey.

Magnetic data typically do not detect the presence of at- or near-surface (shallow) objects when the height of the cesium sensor is held about 6 ft above the ground. In general, this field technique filters out the signature of small metallic surface objects; however, the instrument is capable of detecting large signals typical of the response observed from USTs or other deeply buried metallic objects, if present.

Electromagnetic (EM) surveys were completed using a Geonics EM-61 time-domain metal detector. The EM-61 was operated in the wheel mode with data collected on five foot line spacings (east to west) and 0.65 foot station spacings (north to south).

Horizontal control for the FMP survey was achieved by using a 200-foot tape measure to lay out a square grid using the fences along the northern and western boundaries of the FMP area. Geophysical lines and appropriate fiducial markers were laid out on this grid. The FMP grid measured 400 ft in the east-west direction and 300 in the north-south direction. The FMP grid was laid out according to historic site maps and building corners determined by Stone and Webster personnel.

For survey control at the OMS site, a grid measured 300 ft in the east-west direction and 170 ft in the north-south direction was laid out. MGC did not collect EM or mag data within the limits of Building 505. This was in accordance with directions from Stone and Webster personnel. At both survey areas every 10-foot line was marked along the north and south baselines with pin flags to enable the operator to stay on line; and, fiducial lines were marked at half the north-south distance to confirm location along each line. With this grid layout, the operator could estimate between the 10-foot markers for the intermediate 5-foot line spacings.

Additional information about the EM and Magnetism methods is located in the detailed method appendix at the back of this report.

RESULTS:

Results of the geophysical survey are shown on the accompanying maps, Figures 4 through 11. Figure 3 identifies the FMP survey area and all the cultural features present that may or may not impact collection and/or interpretation of the mag or EM data. The field data were contoured and presented in color format using Surfer for Windows. (Figures 4 and 6 for the FMP and Figures 8 and 10 for the OMS). For better definition we have presented the mag and EM contour data at a larger scale on black and white computer aided drawings (Figures 5 and 7 for the FMP and Figures 9 and 11 for the OMS).

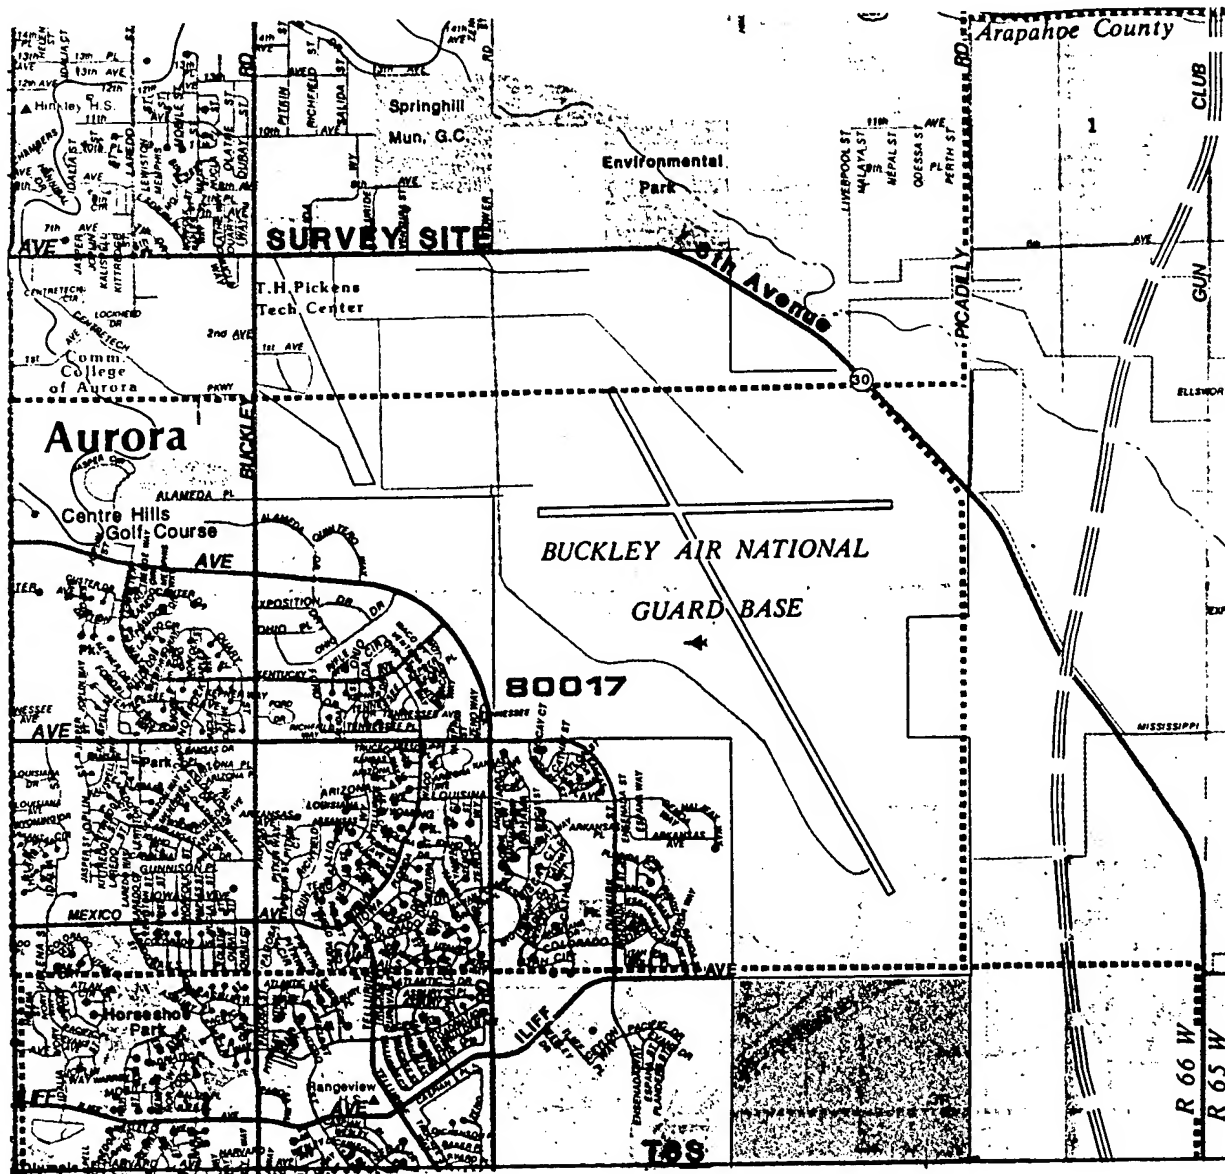

Disks with the Surfer files (swfig*.srf) and AutoCad Version 12 files (swfig*.dwg) have been included in the master copy of this final report.

FORMER MOTOR POOL SITE: The magnetism contour maps show numerous geophysical anomalies within the FMP 400- by 300-foot grid. The total magnetic field contour maps, shown on Figures 4 and 5, indicate the north-central portion of this site is magnetically cluttered. Many of the cultural features defined on Figure 3 are clearly mapped with the mag data.

Only one area is interpreted to be consistent with the presence of UST's (underground storage tanks) or other large buried metallic objects. The area defined on Figure 5 with the corners of the interpreted "most probable location of USTs" has the grid coordinates: NW cor - 236E,260N; NE cor - 273E,260N; SE cor - 236E,210N; and SW cor - 273E,210N.

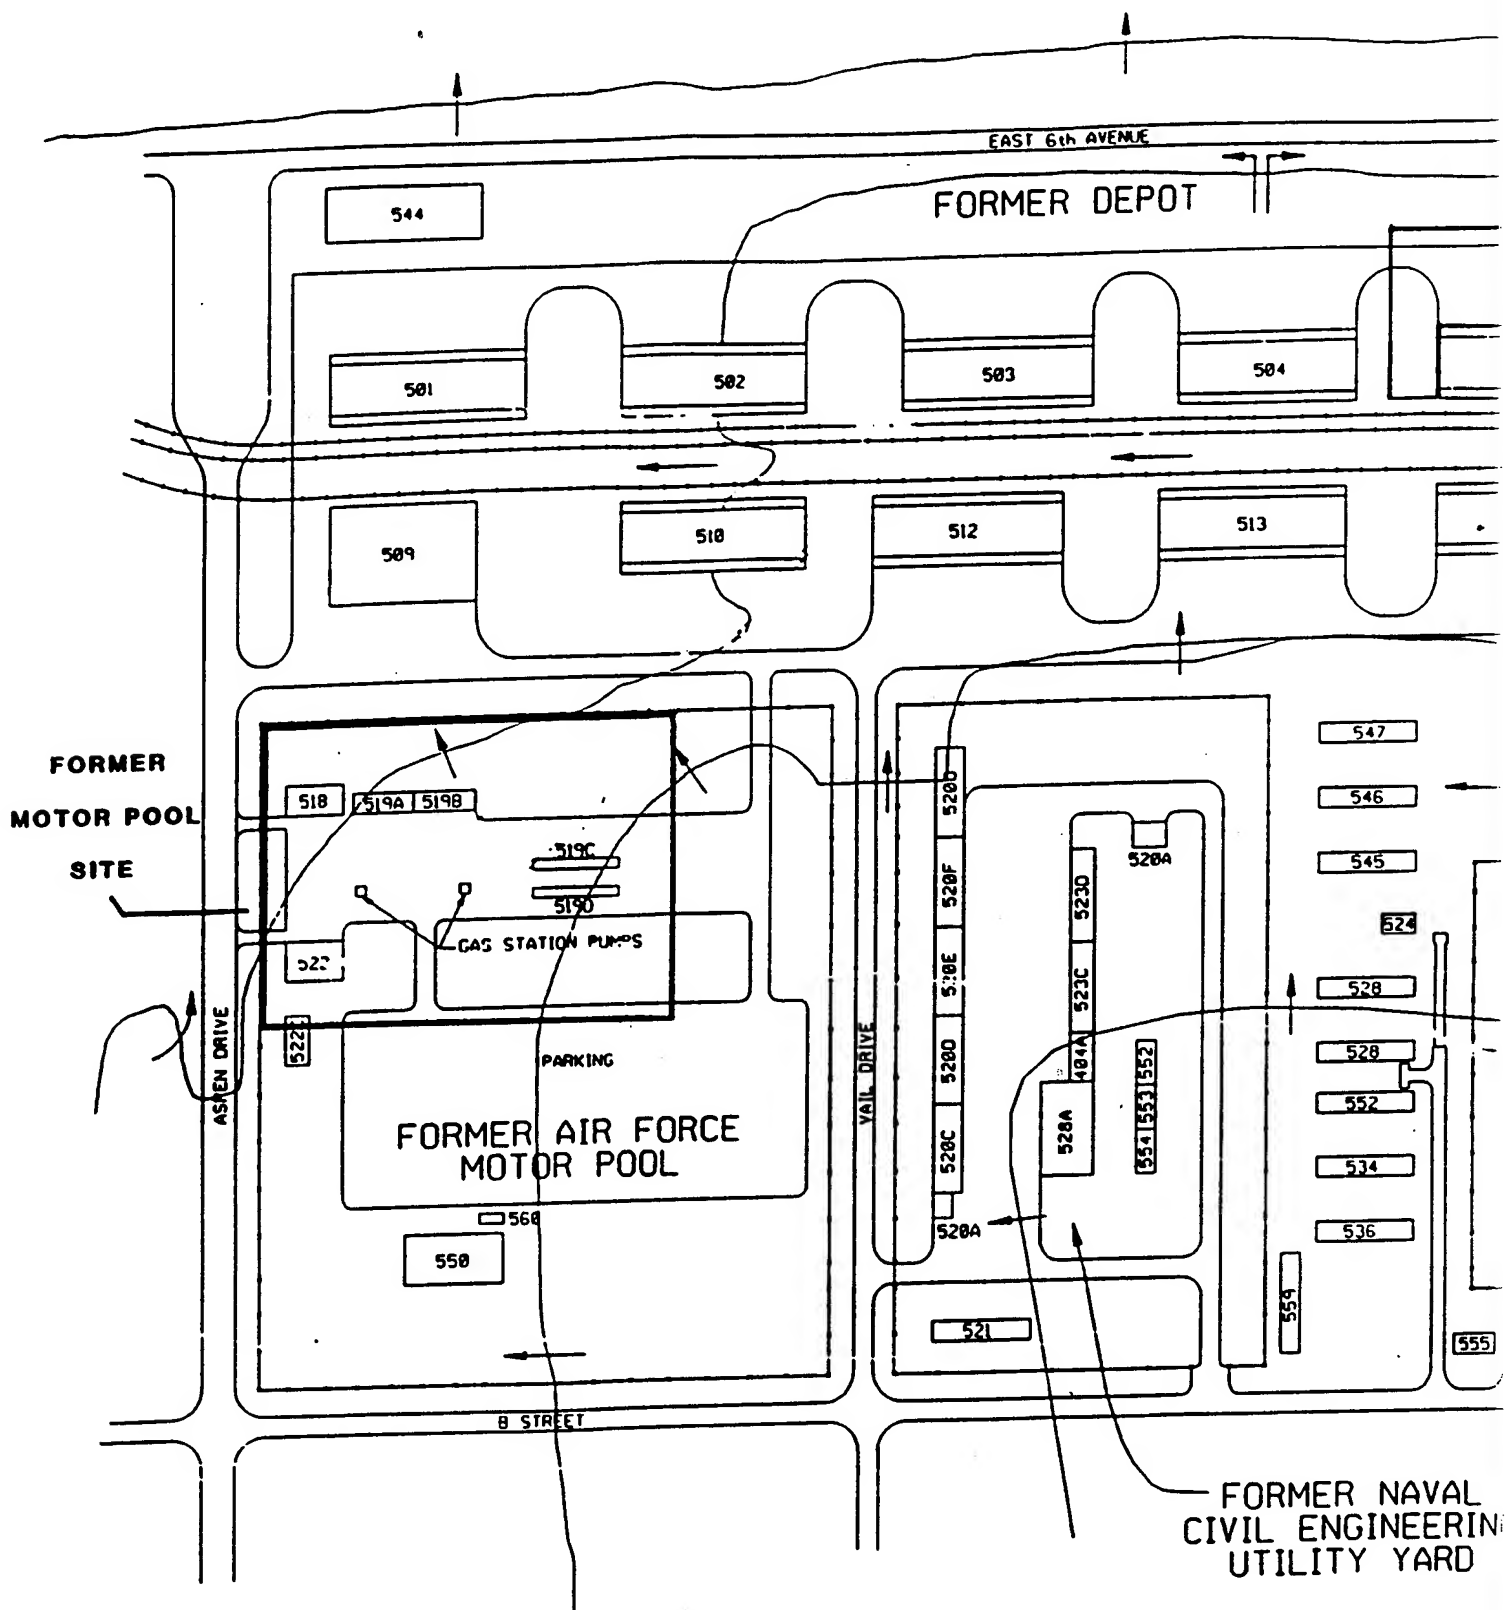

The large dipolar feature centered near distance 240E and 255N is a large amplitude magnetic anomaly (>10,000 nanoTesla). The anomaly is

EM-61 HIGH SENSITIVITY METAL DETECTOR

INTRODUCTION

The Geonics EM-61 is a high-sensitivity high-resolution time-domain metal detector which is used to detect both ferrous and non-ferrous metallic objects. It consists of a powerful transmitter that generates a pulsed primary magnetic field, which induces eddy currents in nearby metallic objects. The decay of these currents is measured by two receiver coils mounted on the coil assembly. The responses are recorded and displayed by an integrated data logger as two channels of information. For further processing and interpretation data can be transferred to PC computer.

The EM-61 detects a single 200 litre (55 gal) drum at a depth of over 3 meters beneath the instrument, yet it is relatively insensitive to interference from nearby surface metal such as fences, buildings, cars, etc. By making the measurement at a relatively long time after termination of the primary pulse, the response is practically independent of the electrical conductivity of the ground.

Due to its unique coil arrangement, the response curve is a single well defined positive peak, greatly facilitating quick and accurate location of the target. The depth of the target can be estimated from the width of the response and/or from relative response from each of the two receiver coils.

The EM-61 consists of three major parts: coil assembly, backpack with battery and processing electronics and digital data recorder.

EM-61 Interpretation

The EM-61 is designed in such a way that it is possible not only to separate anomalies spatially but it is also possible under some conditions, to distinguish deeper targets from shallow ones. In addition, the unique two receiver coil system allows suppression of near surface targets that may mask response from deeper more important ones. This feature is very useful when the purpose of the survey is to locate deeper targets, like underground storage tanks or drums, in presence of shallow near surface metallic objects (manhole covers or metal scrap).

Because the amplitude of response is highly depended on the distance between the coil assembly and target, small near surface anomalies will very often produce a response orders of magnitude larger than much bigger but deeper targets. This masking effect from near surface material is drastically reduced by using output of two coils and processing them in the differential mode. In this case output from channel 1 is subtracted from channel 2. Channel 1 represents data from top receiver coil, whereas channel 2 is data from coil closer to the ground. The calculation is automatically performed by EM-61 DAT61 computer program.

The most common way of interpretation of EM-61 data is by using channel 2 and difference channel data.

The difference channel is calculated in the following way:

$$D = k \cdot CH1 - CH2$$

Where: D is differential output in mV
CH1 is output from top coil in mV
CH2 is output from bottom coil in mV
k is depth coefficient normally set to 1

It is possible to vary k, and adjust the depth at which the response will be suppressed the most. If k is selected to be 1, the response from targets right below the surface will be reduced the most. If the coefficient k is made smaller than 1, the deeper target will be suppressed more than shallow targets. In this case surface anomalies will have negative response in the difference channel.

It should be noted that the degree of cancellation will be affected by size, shape and depth of targets. The response from the targets shaped like balls, spheres or small plate-like targets parallel with the ground can be reduced more than response from larger 3-dimensional targets.

Note that the negative values on the differential channel map are often associated with the metallic objects located on the surface, assuming that the depth coefficient of 1 is used (normal practice).

Calculation of Apparent Depth of Target

The user can estimate an approximate depth (apparent depth) of a target. This parameter is calculated on the basis of ratio of amplitude from channel 1 and channel 2 response. The apparent depth estimation is most accurate when the instrument is positioned over the center of buried target. (an additional reason from choosing the spacing between the survey lines). In order to determine position of an anomaly, the peak response of the channel 2 profile should be examined along the survey line as well as on the neighboring survey lines. By comparing responses of nearby lines and selecting anomaly maximum, it is normally easy to locate the position of the target. The apparent depth is determined at the highest point of the anomaly.

It should be noted that the calculation of depth is an approximation. The accuracy of estimation will depend on the

relation between the line (station) and center of the target, the size and shape of target, as well as the quality of data.

Depth estimation for the small ball-shaped targets will be more accurate than the estimate for larger targets (like underground storage tanks or pipes). Depth for the larger targets will be normally overestimated, meaning that the anomaly will appear deeper than it actually is.

In order to improve depth estimation accuracy, especially for deeper targets with low response, it may be necessary to remove a small offset from the readings. Although each instrument prior to leaving the factory, has outputs of both channels adjusted to read zero, it is possible that with time a small offset of several millivolts appears at the output(s). This effect could be recognized as a small non-zero shift in readings over the portion of the survey line that has no visible anomaly response.

Surface Metal Discrimination

The EM-61 has another very useful feature. For surveys carried out in areas where there is a large amount of near surface metal, a second coil is utilized. The design of this coil is such that this near surface metal response can be made virtually zero, greatly facilitating the detection of deeper targets such as buried drums. Conversely, it is also possible, using the coil, to make the response from near surface metal to have one polarity, while that from deeper metal (the actual depth can be adjusted) is of opposite polarity, so that distinguishing between the two is rendered very simple.

The interpretation of EM-61 data is often qualitative as the metal detector is an excellent "anomaly finder".

Technical Specifications - EM-61

Measured Quantity: Two channels of secondary response in mV

EM Source: Air cored coil, 1 x 1 m size

Current Waveform: Bipolar rectangular current with 50% duty cycle

EM Sensors: A) Main: Air-cored coil, 1 x 1 m in size,
coincident with EM source
B) Focussing Air-cored coil, 1 x 1 m in size
40 cm above main coil

Maximum Output: 40,000 mV for low gain
10,000 mV for high gain

Dynamic Range: 18 bits

Display: 4-line LCD with 16 characters per line

Data Storage: Solid-state memory for up to 20,364 records

Power Supply: 12 V rechargeable battery for 4 h continuous operations

Operating Weight & Dimensions: Backpack: 10 kg; Coil Assembly: 16.5 kg
(24 kg trailer mode)
Backpack: 60 x 30 x 10 cm
Coil: a) Main: 100 x 100 x 5 cm
b) Focussing: 100 x 100 x 2 cm

Shipping Weight & Dimensions 61 kg (86 kg with trailer)
104 x 104 x 22 cm (Box 1)
54 x 54 x 52 cm (Box 2) with trailer option only

MAGNETICS

INTRODUCTION

The magnetometer is a sensitive instrument which can be used to map spatial variations in the Earth's magnetic field. Magnetometers are highly portable instruments which are operated manually. In the proton magnetometer, a magnetic field which is not parallel to the Earth's field is applied to a fluid rich in protons causing them to partly align with this artificial field. When the controlled field is removed, the protons precess toward realignment with the Earth's field at a frequency which depends on the intensity of the Earth's field. By measuring this precession frequency, the total intensity of the field can be determined.

For some purposes a close approximation of the gradient of the field is determined by measuring the difference in the field between two closely spaced sensors. In principle, the gradient of any component of the total intensity of the field can be measured in the vertical direction or any horizontal direction. In practice the quality measured most commonly is the vertical gradient of the total field.

Ground magnetic measurements are usually made with portable instruments at regular intervals along more or less straight and parallel lines which cover the survey area. Often the interval between measurement locations (stations) along the lines is less than the spacing between lines. Ordinary land surveying methods are used to establish stations at which measurements are made; accuracy of 1-10 feet in plan is usually required.

To make accurate anomaly maps, temporal changes in the Earth's field during the period of the survey must be considered. Normal changes during a day, sometimes called diurnal drift, are a few tens of gammas but changes of hundreds or thousands of gammas may occur over a few hours during magnetic storms. During severe magnetic storms, which occur infrequently, magnetic surveys should not be made. There are a number of methods of correcting surveys for temporal variations. For ground surveys, one method is to establish a base or reference station in the survey area and to repeat measurements at this base at frequent intervals. All of the measurements at field stations are then corrected by assuming a linear change of the field during the time interval between repeat base station readings. This method works well provided the earth's field is relatively quiet. Sometimes continuously recording magnetometers are used at fixed base sites to monitor temporal changes. If time is accurately recorded at both base site and field location the field data can be corrected by subtraction of the variations at the base site. This method works very well for surveys of small areas, provided the base site is in or near the area. It does not work well for surveys of large areas because, over a large area (tens of kilometers), temporal variations vary

August 5, 1994

spatially in an unpredictable manner.

Intense fields from man-made electromagnetic sources can be a problem in magnetic surveys. Most magnetometers are designed to operate in fairly intense 60 hertz and radio frequency fields. However extremely low frequency fields caused by equipment using direct current or the switching of large alternating currents can be a problem. Pipelines carrying direct current for cathodic protection can be particularly troublesome. With great care, airborne anomalies on the order of one nT or less can be mapped in areas of very gentle magnetic expression. Although some modern ground magnetometers have a sensitivity of 0.1 nT, sources of cultural and geologic noise usually prevent full use of this sensitivity in ground measurements.

After all corrections have been made magnetic survey data are usually displayed as individual profiles or as contour maps. Geologic interpretation of magnetic anomalies is carried out by comparison with theoretical anomalies calculated for idealized geologic models, comparison with anomalies over known geologic features, and from constraints provided by other geophysical and geological results in the area. Identification of anomalies caused by cultural features, such as railroads, pipelines, and bridges is commonly made using field observations and maps showing such features. There are no well established analytical procedures to follow for identification and location of such features.

BACKGROUND

The Earth possesses a magnetic field caused primarily by sources in the core. The form of the field is roughly the same as would be caused by a dipole or bar magnet located near the Earth's center and aligned subparallel to the geographic axis. The intensity of the Earth's field is customarily expressed in S.I. units as nanoTeslas (nT) or in an older unit, the gamma. Except for local perturbations, the intensity of the Earth's field varies between about 45,000 and 60,000 nT over the coterminous United States.

Many rocks and minerals are weakly magnetic or magnetized by induction in the Earth's field, and cause spatial perturbations or "anomalies" in the Earth's main field. Man-made objects containing iron or steel are often highly magnetized and locally can cause large anomalies up to several thousands of nT.

Magnetic methods are generally used to map the location and size of ferrous objects. Determination of the applicability of the magnetics method is done by an experienced engineering geophysicist. Modeling and incorporation of auxiliary information may be necessary to produce an adequate work plan.

The Earth's magnetic field dominates most measurements on the surface of the earth. Permanently magnetized earth materials with

August 5, 1994

fields like a common bar magnet are the exception. A secondary magnetic field is induced in most materials when the material is in the presence of a strong magnetic field such as the Earth's. Induced magnetization refers to the action of the field on the material wherein the ambient field is enhanced causing the material itself to act as a magnet. The field caused in such a material is directly proportional to the intensity of the ambient field and to the ability of the material to enhance the local field-a property called magnetic susceptibility. The induced magnetization is equal to the product of the volume magnetic susceptibility and the inducing field of the earth:

$$I = k F$$

Where I is the induced magnetization per unit volume in cgs electromagnetic units (A vector)
 F is the external field intensity in teslas (A vector)
 k is the volume magnetic susceptibility.

For most materials k is much less than 1 and, in fact is usually of the order of 10^{-6} for most rock materials. From a geologic standpoint, magnetite and its distribution determine the magnetic properties of rocks. The susceptibility of magnetite is about 0.3. There are other important magnetic minerals in mining prospecting, but the amount and form of magnetite determines how most rocks respond to an inducing field. Iron, steel and other ferromagnetic alloys have susceptibilities one to several orders of magnitude larger than magnetite. The exception is stainless steel which is only weakly magnetic.

The importance of magnetite cannot be exaggerated; some tests on rock materials have shown that a rock containing one percent magnetite may have a susceptibility as large as 10^{-3} , or one thousand times larger than most rock materials. The following list gives some typical values for rock materials-note that the range of values given for each sample depends on the amount of magnetite present.

ROCK TYPE	SUSCEPTIBILITY
Altered ultra basics	10^{-4} to 10^{-2}
Basalt	10^{-4} to 10^{-3}
Gabbro	10^{-4}
Granite	10^{-5} to 10^{-3}
Andesite	10^{-4}
Rhyolite	10^{-5} to 10^{-4}
Shale	10^{-5} to 10^{-4}
Schist and other	
Metamorphic Rocks	10^{-4} to 10^{-6}
Most Sedimentary Rocks	10^{-6} to 10^{-5}
Limestone and Chert	10^{-6}

Thus it can be seen that in most engineering and environmental scale investigations, the sedimentary or alluvial sections will not show sufficient contrast such that magnetic measurements will be of use in mapping the geology. However, the presence of ferrous

August 5, 1994

materials in ordinary municipal trash and in most industrial waste does allow the magnetometer to be used in direct detection of landfills and other disposal features. Underground steel tanks, where isolated from interfering anomalies, cause easily detected magnetic anomalies.

FIELD WORK

The magnetometer is operated by a single person. However, grid layout, surveying or the buddy system may require the use of another technician. If two magnetometers are available production is usually doubled as the ordinary operation of the instrument itself is straight forward. The use of a base station is covered above. Additionally, some QC/QA procedures require that several field-type stations be occupied at the start and end of each day's work. The incorporation of computers and non-volatile memory in magnetometers has greatly increased the ease of use and data handling capability of magnetometers. The instruments typically will keep track of position, prompt for inputs, and internally store the data for an entire day of readings. Downloading the information to a personal computer is straight forward and plots of the results of the day's work can be prepared each night. The base magnetometer is activated every day prior to collection of any ground magnetic data. It is placed at least 100 feet from any metal objects or travelled roads and at least 500 feet from any power lines. The sensor is mounted above the ground surface and rotated until the sensor is properly oriented (if there is a preferred orientation marked on the sensor). The unit (see operator's manual) is activated and the time is recorded. At the end of the field day, the unit is deactivated and the time is recorded.

Steel and other ferrous metals in the vicinity of a magnetometer can distort the data. Thus, large (steel) belt buckles, etc. must be removed when operating the unit. The magnetic effect of any potentially offensive article should be tested for its effect on magnetic data. If a compass is carried, the magnetometer reading must be made more than ten feet from it.

A final test is to immobilize the magnetometer and take readings while the operator's body is moved to different directions around the sensor. If the readings do not change by more than a nT or so, the operator is "magnetically clean". If the readings do change, the operator must find the ferrous object on the operator's person that is causing the problem. Zippers, watches, glasses frames, boot grommets, room keys, pencils, and almost anything else can have steel or iron in them. On very precise surveys, the operator effect must be held under one nT.

To obtain a representative reading, the sensor should be held well above the ground. This procedure is done because of the probability of collections of soil magnetite disturbing the reading

August 5, 1994

at the station. In rocky terrain where the rocks have some percentage of magnetite, sensor heights of up to 12 feet have been used to remove near-surface effects. One obvious exception to this is some types of ordnance detection where the objective is to detect near-surface objects. Often a rapid-reading magnetometer is used (cycle time less than 1/4 second) and the magnetometer is used to sweep across an area near the ground. Small ferrous objects can be detected, and spurious occurrence of soil magnetite can be recognized by their lower amplitude and dispersion. Ordnance detection requires not only training in the recognition of the dangerous objects, but experience in separating small intense and interesting anomalies from more dispersed geologic noise.

On some magnetics surveys the field magnetometer must be read several times at each station until three readings agree to within 1 nT. On other surveys you must read the unit several times and record each reading. The work plan will specify which technique is required for a given survey. In either case, the time of the reading is also recorded unless the magnetometer stores the readings and times internally.

Sheet-metal barns, power lines, and other potentially magnetic objects will occasionally be encountered during a magnetic survey. When a magnetic reading is taken in their vicinity, they must be described and the distance from them noted in the field book or on a separate cultural survey map of the site.

The experienced magnetics operator will be alert for the possible occurrence of the following conditions:

1. Excessive gradients beyond the magnetometers ability to make a stable measurement. Modern magnetometers give a quality factor for the reading or otherwise indicate a successful determination of the value of the field. Multiple measurements at a station, minor adjustments of the station location and other adjustments of technique may be necessary to produce repeatable, representative data.
2. Nearby metal objects which may cause interference. Some items, such as automobiles are obvious, but some subtle interference will be recognized only by the imaginative and observant magnetics operator. Old buried curbs and foundations, buried cans and bottles, power lines, fences, and other hidden factors can greatly affect magnetic readings.

INTERPRETATION

Total magnetic field disturbances or anomalies are highly variable in shape and amplitude; they are almost always asymmetrical, sometimes appear complex (even from simple sources), and usually portray the combined effects of several sources. Ambiguity is present in the method in that an infinite number of possible

August 5, 1994

sources can produce a given anomaly. This ambiguity is illustrated in Figure M-1 where identical magnetic anomalies are accounted for by quite different distributions of causative materials.

One additional difficult issue is the fact that most magnetometers used measure the magnitude of total field of the earth. The direction of the field is not recorded. The consequences of this fact is that only the component of a anomalous field in the direction of earth's main field is measured. Figure M-2 illustrates this consequence of the measurement technique.

The induced nature of the measured field makes even large bodies act as dipoles, that is like a large bar magnet. If the (usual) dipolar nature of the anomalous field is combined with the measurement system that measures only the component in the direction of the earth's field, the difficult nature of most magnetic interpretations can be appreciated. To achieve a qualitative understanding of how some anomalies may look, consider Figure M-3. From this figure, based on a distributed body of narrow width perpendicular to the profile, one can see how the dipolar nature of the anomaly is muted. The negative portion of the anomaly is less than 1/10 of the positive anomaly. Figure M-4 however, illustrates the anomaly due to a thin but more distributed body. The body in figure M-4 is long perpendicular to the profile. Its narrow width is another factor which adds to the negative anomaly off to the north of the body. In Figure M-4 the negative portion of the anomaly is nearly 1/3 of the size of the positive portion. Note that for the body in Figure M-4, the body is located closer to the inflection point in the total field measurement rather than to the peak of the anomaly.

Investigation Derived Waste Letter Report Summary

Former Warehouse Area Site Investigation
Buckley Air National Guard Base
Aurora, Colorado

Summary report on IDW generated and tested during the FWA SI

* * * This page intentionally left blank. * * *

Buckley ANG Base Site Investigation of Former Warehouse Area Management and Disposal of Investigation Derived Waste

Three types of wastes were produced during the Site Investigation:

- Water from equipment decontamination;
- Water produced during purging/developing the monitoring wells/piezometers); and
- Soil from drill cuttings, direct push equipment cuttings, and equipment decontamination).

Management and disposal of these wastes depends on the level of contaminants, and upon Federal, State and local regulations. If levels of contamination are detected that cause the waste to be regulated as a hazardous waste, disposal within 90 days of receiving analytical results is required. Analytical results were received on 2/27/97, therefore disposal is required by 5/28/97.

FWA-DR-04
FWA-DR-05

Based upon review of the data, purge water from MW3 and MW4, and PZ5 exceeds the criteria for selenium (1.0 mg/l) in 40 CFR 261.24, which characterizes the purge water as hazardous waste. Purge water from MW 6 and MW7 exceed the TCLP level for both selenium and lead (5.0 mg/l). Purge water from MW4 also exceeds the TCLP for tetrachloroethene (0.7 mg/l).

Three options are available in Colorado:

1. disposal at a site permitted to handle the water,
2. receipt of a permit to discharge to the POTW, or
3. receipt of a permit to the surface discharge.

In the State of Colorado, a permit to discharge to the surface or to a POTW for this minimal volume of water could be obtained in a short period of time (1 week). However, to discharge, the CDPHE would require treatment to reduce the levels of contamination to a lead concentration of 31 ppb and TCE at 5 ppb.

RECOMMENDATION: The cost of the permit application (\$100.00), treating the water, and reanalyzing the water after treatment to validate that the treatment levels are met would exceed offsite disposal. Due to the small volume of water present (5 drums - 250 gallons) off-site disposal is recommended.

SOILS MANAGEMENT AND DISPOSAL

Drums: FWA-DR-06
FWA-DR-07
FWA-DR-09
FWA-DR-10
FWA-DR-13

Soil cuttings exist from monitoring wells 1 and 2, PZ5, direct push, and from decontamination pad soils. These soils were analyzed for TCLP VOCs, SVOCs, and metals. Barium and lead were detected below TCLP regulatory criteria. No other TCLP compounds were detected.

RECOMMENDATION: Soil is classified as non-hazardous. Submit analytical results to the State and request approval to dispose of the soil onsite.

DECONTAMINATION WATER MANAGEMENT AND DISPOSAL

Drums FWA-DR-14

Water from this drum was analyzed for flashpoint, halogenated and aromatic VOCs, and metals. Flashpoint and all concentrations of detected compounds are below City of Aurora wastewater discharge limitations.

RECOMMENDATION: Decontamination water is non-hazardous. Disposal to surface water requires a permit; however, due to the low levels of metals, expensive pre-treatment and re-analysis of the water after treatment would be required. Based upon review of the levels of contamination and discussions with the State, there are two possible disposal options:

1. Submit analytical results to the City of Aurora and request approval to dispose within the City sanitary sewer system. The City may allow disposal to the POTW provided the water can be trickled into the system over some period of time.
2. Due to the small volume of water (and the low levels of metal contamination), the State will allow disposal onto the ground, provided the water is disposed in an upland location, rather than a drainage swale or watercourse.

Appendix G

Slug Testing

Former Warehouse Area Site Investigation

1.0 Introduction

Slug testing was performed as part of the FWA SI for all installed piezometers and monitoring wells to determine the hydraulic conductivity of the shallow aquifer. Slug testing was performed on November 21, 25, and 26, 1996 follow the completion of the first groundwater sampling round. A total of eleven tests were performed. One slug test was performed at each piezometer and monitoring well except for piezometer PZ2 for which two tests were performed.

2.0 Procedure

Rising head slug tests were performed for all installed piezometers and monitoring wells. Slug testing consisted of displacing a known volume of water within the piezometer or monitoring well with a slug ballast that is lowered into the monitoring well. The water level was allowed to equilibrate to within 90% of initial water level conditions, then the ballast was quickly raised from the well. The water level recovery response within the well was recorded with an electronic data logger using a level-type pressure transducer. The well response time-drawdown recovery was then analyzed to obtain aquifer hydraulic conductivity values. Only rising head slug tests were applicable since only water table conditions were encountered.

The slug ballast consisted of a 4-foot long, 1-inch diameter PVC pipe that was filled with sand and sealed at both ends. The volume of the slug ballast is approximately 0.022 ft³ (0.164 gallons). The decontaminated slug ballast was lowered and raised within the piezometer or monitoring well with nylon rope.

Electronic measuring equipment consisted of a Hermit Data Logger (model 2000) connected to an electronic pressure transducer (Hermit model PTX-161). The pressure transducer was installed at the bottom of the piezometer or well and connected to the data logger via electric cable. The data logger converted the electronic signal from the transducer into depth of water. The data logger was used to electronically record changing water levels within the piezometer or monitoring well during the slug test. This data was then electronically transferred to a portable computer for subsequent data interpretation.

Slug tests were conducted for a minimum of 40 minutes to obtain adequate data for aquifer conductivity analysis.

3.0 Analysis

Analysis of the slug test data consists of three steps. The first step involves the screening of the raw data to determine that usable data was obtained for subsequent analyses. The second step involves analysis of the data using the appropriate analytical method. The final step calculates the geometric mean of the hydraulic conductivity data and evaluates spatial differences.

3.1 Raw Data Screening

Examination of the raw slug test data indicates that it is acceptable for analytical analysis. Attachment I contains the raw data from each slug test. This data includes the time of each measurement, depth to water within the well, and a semi-log plot of groundwater level and time.

Each data plot represents the characteristic sudden rise in water level followed by a slower gradual rise in water level through time. The rise in water level is generally one foot or less during the duration of the slug test for each well. The initial sudden rise in water level is primarily the result of drainage from the well screen sand pack into the well. A break in the slope of the water level versus time plot occurs within 30 to 60 seconds following initiation of the test. This secondary slope is representative of aquifer conditions.

The data contains no erratic changes in water level suggesting a malfunction of recording equipment or operator error. These factors indicate that the data is acceptable for further analysis.

3.2 Analytical Analysis

The Bower and Rice method (Bower 1976) was used to analyze the slug test data. This method is based on Thiem's equation utilizing straight line "best fit" techniques coupled with empirical values for hydraulic head dissipation based on various well geometries. Hydraulic conductivity is determined by this method. The following steps and equations outline the Bower and Rice method.

Step 1: On semi-log paper, plot the observed head (Y_t) against the corresponding t . Place Y_i on the logarithmic scale.

Step 2: Select a "best fit" straight line through the plotted points.

Step 3: Using the "best fit" straight-line plot, calculate $(1/t)\ln(Y_o/Y_t)$ for an arbitrarily selected value of t and its corresponding h_t .

Step 4: The Bower and Rice method graphically presents empirical parameters derived from well geometries. Knowing length of the well screen/sand pack (L) and combined radius of the well screen and sand pack (r_w), determine parameters A and B from D/r_w if the tested well is partially penetrating, or determine parameter C if the well is fully penetrating. (see Bower, 1976, to determine these parameters).

Step 5: Calculate $\ln(R_e/r_w)$:

If the well is partially penetrating then calculate $\ln(R_e/r_w)$ from equation 1.

$$\ln \frac{R_e}{r_w} = \left[\frac{1.1}{\ln \frac{H}{r_w}} + \frac{A + B \ln \left[\frac{D - H}{r_w} \right]^{-1}}{L/r_w} \right] \quad (1)$$

If the well is fully penetrating then calculate $\ln(R_e/r_w)$ from equation 2.

$$\ln \frac{R_e}{r_w} = \left[\frac{1.1}{\ln \frac{H}{r_w}} + \frac{C}{L/r_w} \right]^{-1} \quad (2)$$

Where: A, B, C = parameters from Figure G-1
 D = entire unconfined aquifer thickness
 H = saturated thickness of aquifer from water table to bottom of well
 L = length of well screen or open section of well

Step 6: Calculate K from equation 3.

$$K = \frac{r_c^2 \ln \left(\frac{R_e}{r_w} \right)}{2L} \frac{1}{t} \ln \frac{Y_o}{Y_t} \quad (3)$$

Where: r_c = radius of the unscreened part of the well where the head is rising

A computer program (Hall, 1996) was used to assist with curve matching and calculation of hydraulic conductivity. Computer program input and output parameters are presented in Attachment II.

A summary of calculated hydraulic conductivity values is presented in Table G-1.

The range of hydraulic conductivity values across the FWA is fairly uniform. Conductivity values have a variation of less than 2 orders of magnitude ranging from 4.93×10^{-6} ft/s at FWAMW03 to 8.79×10^{-7} ft/s at FWAPZ01. An area of relatively high conductivity is evident across the FWA from the area of monitoring well FWAMW06 and FWAMW07 to piezometer FWAPZ02 to the northeastern side of the site in the vicinity of monitoring well FWAMW03. Areas of relatively low hydraulic conductivity occur in northwest, southwest, and central eastern portion of the FWA as determined by piezometers FWAPZ03, FWAPZ01, and FWAPZ04. The distribution of hydraulic conductivity values across the FWA is presented in Figure G-2.

Figure G-1
Empirical Parameters

Table G-1 Calculated Hydraulic Conductivity		
Piezometer/Monitoring Well	K (ft/s)	K (cm/s)
FWAPZ01	8.797×10^{-7}	2.683×10^{-5}
FWAPZ02 (test 1)	2.033×10^{-6}	6.201×10^{-5}
FWAPZ02 (test 2)	2.213×10^{-6}	6.750×10^{-5}
FWAPZ03	1.690×10^{-7}	5.155×10^{-6}
FWAPZ04	3.821×10^{-7}	1.001×10^{-5}
FWAPZ05	1.286×10^{-6}	3.922×10^{-5}
FWAPZ06	1.926×10^{-6}	5.874×10^{-5}
FWAMW03	4.931×10^{-6}	1.504×10^{-4}
FWAMW04	1.489×10^{-6}	4.541×10^{-5}
FWAMW06	1.392×10^{-6}	4.246×10^{-5}
FWAMW07	1.602×10^{-6}	4.886×10^{-5}

3.3 Geometric Mean

The geometric mean is used to determine the average hydraulic conductivity for a given site. If two or more slug test results are available from different wells within the same hydrogeologic unit then the geometric mean is used to determine the average hydraulic conductivity of the site. The geometric mean is determined by equation 4.

$$\bar{n} = \sqrt[i+z]{(X_i)(X_{i+1}) \cdots (X_{i+z})} \quad (4)$$

The hydraulic conductivity geometric mean calculated for the FWA shallow aquifer is 1.17×10^{-6} ft/s (3.57×10^{-5} cm/s). (The geometric mean of the two Piezometer PZ2 tests (2.121×10^{-6} ft/s) was used in this calculation). The hydraulic conductivity geometric mean value is representative of a silts, loess, silty sands, and clays. These lithologic materials typical comprised the shallow aquifer at the FWA.

4.0 General Discussion

In general, calculation of the geometric mean for hydraulic conductivity for a site should be used with caution if the geology of a site is complex. The geologic borings for each piezometer or well should be studied to determine if all wells can be grouped together or in separate subgroups representative of specific geologic conditions at the site.

The degree of hydraulic conductivity measured at each piezometer or monitoring well is reflective of the type of lithology encountered within the screened interval. Piezometers or wells which are screened across coarser lithologic material have a high hydraulic conductivity then those screened within finer materials. Monitoring well FWAMW03 is screened across approximately 2 feet of fine to medium sand and as a result, has the highest measured hydraulic conductivity. The relationship between medium/low hydraulic conductivity values and screened lithology is not as evident. For example, piezometers FWAPZ01 exhibits a relatively low hydraulic conductivity but is screened within two to three feet of clayey sand within the shallow aquifer. For several piezometer and wells, the complete lithology of the screened interval is not known due to incomplete recovery of the boring core. This missing lithology may consist of fine or coarse grained material which will influence the hydraulic conductivity of the shallow aquifer.

5.0 Summary

Slug testing was performed as part of the FWA SI for all installed piezometers and monitoring wells to determine the hydraulic conductivity of the shallow aquifer. Rising head slug testing was performed on November 21, 25, and 26, 1996 following completion of the first groundwater sampling round. A total of eleven tests were successfully performed.

The range of hydraulic conductivity values across the FWA is fairly uniform. Conductivity values have a variation of less than 2 orders of magnitude ranging from 4.93×10^{-6} ft/s (1.50×10^{-4} cm/s) at FWAMW03 to 8.79×10^{-7} ft/s (2.68×10^{-5} cm/s) at FWAPZ01. The hydraulic conductivity geometric mean calculated for the FWA shallow aquifer is 1.17×10^{-6} ft/s (3.57×10^{-5} cm/s). An area of relatively high conductivity is evident across the FWA from the area of monitoring well FWAMW06 and FWAMW07 to piezometer FWAPZ02 to the northeastern side of the site in the vicinity of monitoring well FWAMW03. Areas of relatively low hydraulic conductivity occur in northwest, southwest, and central eastern portion of the FWA as determined by piezometers FWAPZ03, FWAPZ01, and FWAPZ04.

6.0 Terms

Unconfined Aquifer

An *Unconfined* or *Water-Table* aquifer is a distinct geologic unit that contains sufficient saturated permeable material to yield significant quantities of water to wells, springs, or excavations, and has an upper boundary to the saturated zone that is free to move upward or downward through the rock or soil matrix, as water is added to or taken from the aquifer. When a well positioned within an unconfined aquifer is pumped, water is released from storage both by elastic response, as in a confined aquifer, and also by draining the pore spaces in the upper portions of the aquifer.

Confined Aquifer

A *Confined* or *artesian* aquifer is a distinct geological unit that contains sufficient saturated permeable material to yield significant quantities of water to a well. It is isolated from the atmosphere at the point of discharge by impermeable geologic formations. Confined groundwater is generally subject to pressure greater than atmospheric. Water within the aquifer is released from storage when pumped.

Hydraulic Conductivity

Hydraulic Conductivity (K) is the volume of water at the existing kinematic viscosity that will move in unit time under a unit hydraulic gradient, through a unit area of the aquifer measured at right angles to the direction of flow. Hydraulic Conductivity is a vector quantity. If direction is not indicated (K_x , K_y , and K_z), then the value is assumed to be measured in the horizontal. Expressed as a velocity, Length/Time.

Storativity

Storativity (S) (sometimes called the Coefficient of Storage) is the volume of water an aquifer releases from or takes into its interstices (pore spaces) per unit of horizontal surface area of the aquifer per unit change in head of the water within the aquifer.

Transmissivity

Transmissivity (T), sometimes called Transmissibility or Coefficient of Transmissibility, is the rate at which water of the prevailing kinematic viscosity is transmitted through a unit width of the aquifer under a unit hydraulic gradient. In a homogeneous aquifer, it is equal to the Hydraulic Conductivity of the aquifer material times the saturated thickness of the aquifer. Transmissivity is expressed in terms of $\text{Length}^2/\text{Time}$ [Hydraulic Conductivity ($\text{Length}/\text{Time}$) times aquifer thickness (Length) equals Transmissivity ($\text{Length}^2/\text{Time}$)].

APPENDIX H

Laboratory Data Package Summary Sheets and Data Evaluation Report

Former Warehouse Area Site Investigation
Buckley Air National Guard Base
Aurora, Colorado

* * * This page intentionally left blank. * * *

Appendix H, which contains the laboratory data packages and Data Evaluation Report for this report, is maintained at the Buckley Air National Guard Base Repository for the Former Warehouse Area Site Investigation.

This information is available for public review. For further information contact:

Mr. Chris Jarboe
Air National Guard Project Manager
National Guard Bureau Readiness Center
3500 Fetchet Avenue
Andrews AFB, MD 20762-5157
(301) 836-8779

Ms. Haley Wihongi
Buckley Air National Guard Base Environmental Manager
PAG/CO/Installation/CEV, Stop 26
660 South Aspen Street
Buckley Air National Guard Base, Colorado 80011-9551
(303) 340-6276

Cpt. James Tipton
Buckley Air National Guard Base Project Manager
PAG/CO/Installation/CEV, Stop 26
660 South Aspen Street
Buckley Air National Guard Base, Colorado 80011-9551
(303) 340-9100

To schedule an appointment to review Appendix H contact Buckley Air National Guard Base at the above.

Note:

ND = Not detected at the reported method detection limit

R = reject

J = estimated value

JH = estimated high value

JL = estimated low value

U = non-detected

D = analyte was diluted to bring within instrument calibration or to remove matrix interferences

Note:

ND = not detected at reported method detection limit

U = non-detected

D = analyte was diluted to bring within instrument calibration or to remove matrix interferences

J = estimated value

B = analyte was detected in laboratory method blank

JL = estimated low value

JH = estimated high value

APPENDIX J

Survey Data

Former Warehouse Area Site Investigation
Buckley Air National Guard Base
Aurora, Colorado

Surveyed horizontal and vertical position of soil borings,
piezometers, and monitoring wells.

STONE & WEBSTER ENGINEERING CORP.
BUCKLEY AIR NAT. GUARD BASE
W.O. 575001515

JOB NO. 96-1005
DECEMBER 19, 1996
ZYLSTRA BAKER SURVEYING, INC.
1510 W. TUFTS AVE.
ENGLEWOOD, CO 80110
PH. (303) 781-0700
FAX (303) 781-4193

PRIMARY CONTROL POINT. GEODETIC COORDINATES PROVIDED.

PT #	LATITUDE	LONGITUDE	ELEVATION
20	39°42'53.93" N	104°45'41.11" W	5588.71

GEODETIC COORDINATES OF THE FOLLOWING POINTS WERE DETERMINED BY GLOBAL POSITIONING SYSTEM (G.P.S.) SURVEY IN NOVEMBER, 1996. THE GEODETIC COORDINATES OF POINT 20 WERE HELD DURING THE NETWORK ADJUSTMENT. ELEVATIONS DETERMINED BY DIFFERENTIAL LEVELING BASED ON POINT NUMBER 20.

GEODETIC COORDINATES OF ADDITIONAL POINTS

PT #	LATITUDE	LONGITUDE	ELEVATION
10	39°43'27.250545" N	104°45'54.254423" W	5537.23
11	39°43'28.279488" N	104°46'18.331990" W	5526.31
12	39°43'20.654697" N	104°46'12.538303" W	5542.81

UNMODIFIED STATE PLANE COORDINATES, COLORADO CENTRAL ZONE, OF CONTROL AND ADDITIONAL POINTS IN FEET.

PT #	NORTHING	EASTING
10	1689518.717	3206722.595
11	1689607.678	3204840.526
12	1688839.820	3205299.396
20	1686155.616	3207777.009

THE STATE PLANE COORDINATES WERE THEN MODIFIED USING THE FOLLOWING PARAMETERS:

MEAN ELEVATION - H = 5548.77 FEET
MEAN ELLIPSOID RADIUS - R = 20925604.5 FEET
MEAN SEA LEVEL FACTOR - $R/R+H = SLF = 0.999734903881$
MEAN GRID FACTOR - GF = 0.9994495265
COMBINED SCALE FACTOR - $SLF * GF = SF = 0.999729400605$
FINAL FACTOR $1/CF = F = 1.000270627264$

COORDINATES LISTED BELOW ARE MODIFIED STATE PLANE COORDINATES, COLORADO CENTRAL ZONE. ELEVATIONS ARE BASED UPON DIFFERENTIAL LEVEL LOOPS RUN THROUGH ALL POINTS, THE BASIS FOR THE ELEVATIONS WAS A PROVIDED ELEVATION OF 5588.71 FOR A 2 1/2" BRASS DISK LOCATED AT THE NORTH END OF RUNWAY 14 (PT # 20).
